

Milestone reached for *InteRRIS*® Subscribers

November 9, 2009, Pueblo, CO... Recently, the total fleet size managed by subscribers to *InteRRIS*® surpassed one-million rail vehicles. Subscribers include railroads, private railcar owners, transit agencies, manufacturers and third-party rail fleet management service providers.

InteRRIS®, designed and developed by TTCI, is a data warehouse and web-based application accessible through the Internet. It contains performance and condition data about rail vehicle wheels, bearings, trucks and more.

InteRRIS® supplies the AAR's Advanced Technology Safety Initiative and the 1.5-million-plus rail vehicles on the North American interchange railroad system with detailed performance data. Besides carrying this enormous responsibility, *InteRRIS*® also provides an extensive range of enhanced subscription services. These services include automated custom performance alerts and daily delivery of millions of performance readings directly to their fleet management applications.

In full production now for over eight years, *InteRRIS*® currently loads, analyzes, and delivers rail vehicle event notifications from over 170 rail wayside detectors worldwide. This amounts to over 90,000 trains, 7,500,000 rail vehicle passes, and over 400,000,000 records per month. Event notices and data are delivered to almost 300 customers daily.
